

- > We have developed a fee management system for an educational institution utilizing SQL as the database language.
- > The underlying architecture of the system has been implemented utilizing the Spring Boot framework.
- > The user interface of the system has been developed and integrated using the React.js library.

To run the project follow these steps:

1. Open an Integrated Development Environments (IDEs) such as IntelliJ IDEA or Visual studio code (consider IntelliJ IDEA as the preferred one)
2. Before running the code we need to connect to the sql database server through localhost:3300 and jdbc:mysql://localhost:3306/feedb where feedb is the database file

To configure open: src > main > resources > application.yml

3. Open the FeeXpert_backend file as a new project file and to run the files open src > test > java > com.dbmsproject.feexpert > FeexpertApplicationTests and then try running the code
4. At first open the FeeXpert_frontend file using an alternative IDE:
 - Install the missing dependencies. You can do it wither manually one by one or use "npm install" for ease.
 - After installing all the dependencies run the react app using "npm start" command on the terminal.
 - This will open up the user interface on your browser which will run on localhost:3000

Once you have started the backed spring server and launched the react app you are good to go to start interacting with the interface.
